Pavithra Subramaniyam

Full Stack Development Student - TAMK, Tampere

With a great motivation, I'm applying for Front-end Developer position listed in your organization. I'm from India, did my bachelor's in Electrical major. I have worked as a selling partner support in Amazon, India, for about 6 years. I was working with various process improvements, solving unsolvable queries to provide the best customer (vendor) experience. I am trained in various division across the supply chain management support for Europe and North American divisions.

I got an offer for Diploma course in Full stack development offered by TAMK. Currently, I have completed my Front-end development module and Backend development module courses, waiting to start Mobile development module. I have been trained in C++, Python, JavaScript, React JS, Node JS, HTML & CSS, Heroku cloud, JUnit testing, Express API, and MySQL. All my course works are in GitHub repositories (link in portfolio).

I have completed a Language learning App with full-stack implementation. Language app has a React based front-end, Node JS based back-end, deployment to the Heroku cloud. Application has two different views. One is for admin, where teacher/admin can add/update/delete words into the database. Other view is user view, in which user can practice the words and they will get the results. I have finished my React coursework with a To-do application, where user can log their tasks which can be viewed using various filters and different views/styles and deployed in Heroku cloud. I have worked on web-shop project for e-commerce to learn the intricacies of git in a team project and deployed in Heroku cloud. Also, I have the experience on data extraction using MySQL (Maria-DB) and testing with JUnit framework. I have created a Dice game using python with UI, where user can customize the number of players and dices. I have also worked with data structures for my C++ and python course works.

I tried to deliver whatever I was given in the course works. But I wanted to have explore more to be a full stack developer, mainly from industrial perspective which is different from academics. I'm proficient enough to be your trainee/Junior developer. I am seeking a good internship more than a job where I can mould myself as a better programmer in all aspects. My working experience and ability to handle the pressure will help me to have an accelerated learning phase. Location or Pay is secondary if there is sufficient learning.

Miscellaneous

- Only fluent in English, studying Finnish course (A2)
- Loves Mathematics and mentoring the team
- Multitasking prioritization, Loves process improvement and initiatives
- Feedback from the employer - 4/5 from yearly performance results
- Self-Evaluation - Above average worker, 4.2/5.0

Though I don't have years of work experience in programming, I have the strong fundamentals and passion to pursue my career towards full stack developer. Hope you help me with that.
